What to expect from the final project

- A Lean artifact connected to something you care about.
- A **3–10 page write-up** explaining your work.
- You can work **individually or in groups of up to 3**.

Proposed goal: a small, coherent contribution that you can explain and demonstrate.

Possible directions

Definitions in your field	A small library of definitions, with key statements formulated in Lean. You do not need to prove every statement by hand.
A useful Lean tool	A tool that makes human-written Lean or the cleanup of AI formalizations easier.
Revisiting an AI project	Understand, check, and clean up an existing result. Explain what you changed and why.
An algorithm	Implement a computation and state or prove useful properties of the code.
A mathematical case study	Formalize a manageable result and explain the choices the formalization requires.

Expectations

- **What I don't want:** brute-force autoformalization, with a pile of generated proofs as the whole project.
- AI can glue pieces together and help make the project work.
- Make a mathematical or technical contribution that **you understand**.
- Explain your choices, check the output, and show what you improved.

Send me your wildest ideas!

Project timeline

October 27–28 Tuesday and Wednesday afternoons	Office check-ins by slots. Exact times to be announced.
November 25 Two weeks before the last class	Progress check: show what works, identify what remains, and adjust the scope.
December 9 Last day of class	Final submission: the project artifact and the 3–10 page write-up.
